Title: Regarding use of Solar Power for clean cooking-laid.

SHRI SRIDHAR KOTAGIRI (ELURU): A perfect solution to clean cooking can be only be achieved by usage of an induction stove powered by a solar energy which can be ideally achieved by a stand alone solar panel on house by house basis. An electric solar stove backed by a solar panel through a efficient battery will enable not only clean cooking but also zero cost cooking.

I would now request the Dept.of Science& Technology to take up a research to come up with a radical solution to derive a perfect Electric Stove back by a Solar panel and battery back up which could be reasonably priced to compete with the traditional LPG usage.

Our Scientists can pride over the fact of reducing emissions and also assisting in reducing poverty world over besides saving billions of foreign exchange for our nation by reducing dependence on LPG. I hope and pray for early and effective solution.
